

Mushroom ended stetoclip listener and variable attenuator

Using the stetoclip hearing aid listener

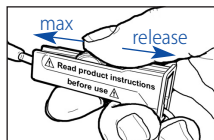

- through the earmould
- If attaching direct to earhook, wet tubing and push cup end up tube so roller clamp does not fall off

A damper is fitted in the tube to give a minimum 10dB approx. attenuation.

Using the variable attenuator

- Push roller fully to narrow end to squash tubing for max. attenuation.
- Turn on hearing aid.
- Slowly roll back wheel until hearing aid can be heard at a comfortable level.
- When packing away stetoclip, fully release wheel to avoid flattening tubing.

Mushroom ended stetoclip listener and variable attenuator
Part No. 22880M

Good hygiene is important – we advise cleaning the ear tip end with a bactericidal cleaning tissue after use. Cleaning tissues and replacement foam ends are available from the Connevens Catalogue, section 6 – Hearing Aid First Aid.
